

# Fly Line - Refill

## Description

Insectrac Flyline is a highly effective solution for managing flies in large open areas such as cattle sheds, poultry units and dairy buildings. The line consists of a white ribbon coated in a thick layer of high-tac glue. Our refills are design to be used with the Insectrac Flyline reel set. This allows fly saturated ribbon to be replaced with new sticky line by simply rotating the reel using the handle. Standard refills are available in 500 m lengths. If a different length or colour is required, please contact us (see details below).

## Specifications

- Lengths of 500m white ribbon wound onto a sturdy plastic reel
- Ribbon width of 4.6mm and thickness of 0.7 mm
- Constructed from Polypropylene String and coated in a high-tac glue
- Glue coating of 60 gsm
- Weight of 1,245 g

## Instructions for Use

Carefully detach the winding system from the empty reel and attach to the replacement reel. Remove the reel loaded with the fly saturated line and dispose of in general waste. Replace with the empty reel. Locate the end of the sticky line on the new reel and, while wearing the nitrile gloves provided, carefully pull the line along the length of the area to be covered and wind onto the empty reel. Finally, tighten the line using the handle system.

As the line becomes saturated with flies or the tackiness is reduced, It can be replaced with a new tacky surface by simply winding the line using the handle system.

## Product Storage

Store at ambient temperatures out of direct sunlight. Store in original packaging to maximise shelf life.

## Packaging

1 refill reel per box

Note: Private label branding and packaging available on request (minimum order quantities apply).

## More information

Refills in a yellow colour or in different lengths can be supplied on request, however these will be dependent upon order volume. For further information, please contact our Customer Services Team using the details provided below.
